technology...experience

FIBER LASER CUTTING

The most common type of laser profile cutter available in industry today is the **FIBER LASER**. **FIBER LASER** cutting offers advantages over other types of lasers for cutting, including cost, efficiency and power. **FIBER LASER** profile cutting has become the industry standard for laser cutting.

Laser cutting with a **FIBER LASER** finish is excellent in comparison to processes such as oxy or plasma and for most applications only minimal post finishing is required. Heat distortion is very minimal, which makes Laser profile cutting suitable for thinner materials. A total solution this combined with our passion to serve our customers, provides a unique combination of World leading cutting solutions and expertise.

Stainless Steel Cutting, Mild Steel Cutting, Carbon Steel Cutting, Aluminum Cutting.

mission is to provide best quality

SignBoard Fabrication

Speed Pro Sign Using all KOC, KNPC & Ministry approved Stickers & Fabrication Materials

3M High Intensity Prismatic Reflective Sheeting Series 3930.

High Intensity Prismatic Reflective Sheeting Series 3930 is a non-metalized microprismatic lens reflective sheeting designed for production of reflective durable traffic control signs, work zone devices and delineators that are exposed vertically in service. Applied to properly prepared sign substrates, high intensity prismatic sheeting provides long-term reflectivity and durability.

Reflective Sheeting

The base retroreflective film is PVC and it is high frequency welded to a vinyl backing which in turn has an acrylic adhesive layer and release liner to the rear. The retroreflective elements are tiny prisms (known as micropisms) that are located to the rear of the base film. The retroreflective elements are thus completely sealed from the external environment protecting them from abrasion and ensuring they work in all conditions.

better quality...quick service
